

# Create a TV Show List

## Project Overview

This project is to implement a way to track a list of anime or tv shows that you have watched. Maybe you want to come back to them and go through a nostalgia walk or have a discussion about the shows you have watched with a friend. It uses mongo and express as a backend to keep track of the show data and the React as a frontend to display a list of the shows. For each show display the name, genre, studio and year created. \*See Data.js

## Implementation

Frontend:

- A get, put and delete method to interact with the backend to write and read data.
- Use either a table or a list to display a list of the shows

Backend:

- Routers are setup for you already
- In anime.js implement a get, put, and delete method to add, delete and retrieve data from your database.

\*Extra Credit:

- Add the cover art for each show that you add in the frontend.
